At a glance

- Strategic cooperation for digital building Management
- Less complexity: Management via a central interface
- Secure: the cloud services are operated in the EU and fulfil the requirements of the GDPR

Strategic cooperation

Digital building management with Siedle and Vixinity

Door communication and access control from Siedle plus smart functions for building management – all via a common user interface. This is made possible by the cooperation between the Black Forest manufacturer and the Swedish software start-up Vixinity.

As part of the cooperation, Siedle integrates its own devices and system control into the Vixinity cloud without media discontinuity. This enables centralised control and networking of building services for administrators and residents via a common user interface.

Siedle Touch 5 or Siedle Touch 10 are used at the entrance. The touch displays support browser-based management, user groups and code lock function and are therefore optimally prepared for integration into the Vixinity Cloud. The connection is made via the Siedle Secure Controller, which enables multi-client capable access management.

Vixinity supplements control at the entrance with additional functions for residents and operators, including shared access, booking systems, a voice-controlled ticket system and displays for electronic building signage. Siedle is responsible for consulting, planning and configuration. Together, Siedle and Vixinity reduce the complexity of administration and create a new quality of digital building control.

Scalable and data protection compliant

The Siedle In-Home bus or Access systems form the technical basis. This enables use in both small and large projects, right up to entire neighbourhood developments. Both systems support mobile door communication via the Siedle app. The cloud services and servers of both companies are operated in the European Union and fulfil the requirements of the GDPR. This means that all administrative and user data remains in the European legal area.

"The cooperation with Vixinity arose from the successful implementation of joint projects in Scandinavia and the USA. These positive experiences and our shared understanding of quality and security convinced us that the collaboration was a good fit," says Frank Schondelmaier, Managing Director Sales at Siedle. "It shows how we at Siedle think about innovation: not as an end in itself, but as a contribution to a better building world – for operators, residents and managers alike."

S. Siedle & Söhne – heading into the future with 275 years of tradition behind it

Siedle, founded in 1750, is a manufacturer of building communication technology and one of the oldest family-run companies in Germany. The company stands for innovative strength, high quality standards, award-winning design, durable products – and Made in Germany: more than 80 percent of the value added still takes place at the original company location today. The portfolio includes video intercom systems, mobile door opening, user-friendly apps and a product family for access control. Siedle products are used in all types of buildings: from intercom systems in single-family homes to integrated IP communication with thousands of access points in residential or industrial complexes.

The traditional device manufacturer is positioning itself for the future in a market environment increasingly characterised by globalisation and digitalisation. What remains constant are the values, culture and mission statement that define the design brand.

Siedle IQ – the new IP system

Siedle IQ is a product family consisting of an IoT platform, apps, digital services and IP video intercom systems. All functions are easy to understand and intuitive to use.

The heart of the system is the IQ platform. This is where electricians, residents, administrators and devices are networked with each other. It digitally maps the entire project process: from planning to remote maintenance during operation. Another advantage is that it provides qualified customer contacts. Builders plan their system online, select a suitable specialist company and can commission it directly. The platform is continuously being developed and expanded with new functions. Security updates are carried out automatically and EU data protection requirements are taken into account.

Siedle IQ systems can be preconfigured in the office using the Config app developed specifically for the system and put into operation with just a few clicks. Siedle IQ supports both LAN/PoE and WLAN with an external power supply. This saves effort and makes the system particularly flexible. The system is compatible with the proven Siedle app, which enables mobile door communication and access control functions via smartphone.
